

GET STARTED WITH CLAUDE CODE

By Emmanuel Apilado | September 2026

```
1 Welcome X 1 README.md X storage-audit.md X Untitled-1 X
2 # Storage Audit - ~/Downloads and ~/Projects
3
4 Scanned 2026-09-23: 20,246 files - ".git" internals excluded - cleanup done the same day with approval.
5
6 ## Result
7
8 | Area | Before | After |
9 |---|---|
10 | ~/Downloads | 3.4 GB | **182 MB** (includes 6 MB waiting for review in 'Duplicates' ) |
11 | ~/Projects | 526 MB | 526 MB (unchanged, on purpose) |
12
13 **Recovered: ~3.2 GB.** Almost all of it came from deleting a stale copy of the GitHub Actions self-hosted runner that was sitting in '~/Downloads'.
14
15 ## Actions taken
16
17 | Action | Space | Notes |
18 |---|---|
19 | Deleted ~/Downloads/actions-runner/ | ~3.3 GB | (A stale copy (versions 2.335.1/2.336.0) of the live runner, first confirmed that the service runs only from '~/actions-runner/' (currently version 2.337.0), has its own credentials from a now Aug 26 registration, and doesn't reference ~/Downloads - The service was still 'active' after the deletion. |
20 | Moved 5 duplicates into ~/Downloads/Duplicates/ | 6.0 MB | Filenames unchanged, as the ~/Downloads/ CLAUDE.md requires. Nothing was deleted. See the table below. |
21 | Kept ~/Downloads/CLAUDE.md | - | Identical to this repo's CLAUDE.md, but the Downloads copy is the working rules file. The one in this repo is documentation. |
22
23 ## 1. Duplicate files (same name + same size)
24
25 Files were grouped by name and size (with '/' copy suffixes ignored), then SHA-256 hashed to confirm.
26
27 4,856 name+size groups: **9,825 confirmed byte-identical**, worth **481 MB**
28 - ~775 MB of that was inside the runner copy, and deleting it removed all of those.
29 - About 438 more groups matched on name and size but had different contents (runner DLLs from different versions). They weren't true duplicates.
30
31 ## Ranked by space freed (biggest first)
32
33 "Space freed" = file size * the number of extra copies, assuming you keep one copy.
34
35 | # | Space freed | Size each | Copies | Duplicate | Status |
36 |---|---|
37 | 1 | **189.7 MB** | 95.9 MB | 3 | Runner 'node20_alpine/bin/node' (in 'externals.2.335.1', 'externals.2.336.0', '_work/update') | Deleted with the runner copy |
38 | 2 | **188.7 MB** | 94.3 MB | 3 | Runner 'node20/bin/node' (same three folders) | Deleted with the runner copy |
39 | 3 | **125.4 MB** | 125.4 MB | 2 | Runner 'node20_alpine/bin/node' | Deleted with the runner copy |
40 | 4 | **117.9 MB** | 117.9 MB | 2 | Runner 'node20/bin/node' | Deleted with the runner copy |
41 | 5 | 143 MB total = 4 MB | 2-3 | ~3,600 smaller runner files (DLLs, node_modules) | Deleted with the runner copy |
42 | 6 | 6.3 MB | 1.1 MB | 2 | ~50 docs, screenshots and manifests shared between 'Projects/Automation/GitHub-Actions-Basic-CI-CD-Pipeline/' and 'Projects/Abis-projects/e-commerce-app/' | Kept (separate git repos) |
43 | 7 | 4.6 MB | 4.6 MB | 2 | ~/Downloads/e-commerce-app/ = ~/Projects/Abis-projects/old-learning-app-e-commerce/ | Moved to Duplicates/ |
44 | 8 | 312 KB | 312 KB | 3 | ~/Downloads/leaps/cba.png (also 'cba.png' in two project 'docs/images/') | Moved to Duplicates/ |
45 | 9 | 389 KB | 389 KB | 3 | ~/Downloads/leaps/CXAO.png (also in two project 'docs/images/') | Moved to Duplicates/ |
46 | 10 | 263 KB | 263 KB | 2 | ~/Downloads/cba (2) = ~/Downloads/cba/ | Moved to Duplicates/ |
47 | 11 | 3 KB | 3 KB | 2 | ~/Downloads/Kubernetes-Configs/db-mariadb-deployment.yaml = Projects/Abis-projects/Abis-Help/e-commerceapp/templates/db-mariadb-deployment.yaml | Moved to Duplicates/ |
48 | 12 | 1 KB | 1 KB | 2 | ~/Downloads/CLAUDE.md = this repo's CLAUDE.md | Kept (working rules file) |
49
50 ## 2. Files over 50 MB not modified in 6 months (before 2026-03-25)
51
52 Only **3 files (283 MB)** qualified, all the same 94.3 MB Node 20 binary inside the runner copy (modified 2026-03-23). All three were deleted with it. Nothing in '~/Projects' qualified.
53
54 Still present, just inside the 6-month window:
55 - ~/Downloads/Installers/google-chrome-stable-current_and64.deb: 119 MB, 2026-04-07
56
57 ## 3. Empty folders (16 found, 13 remaining)
```

Project Overview

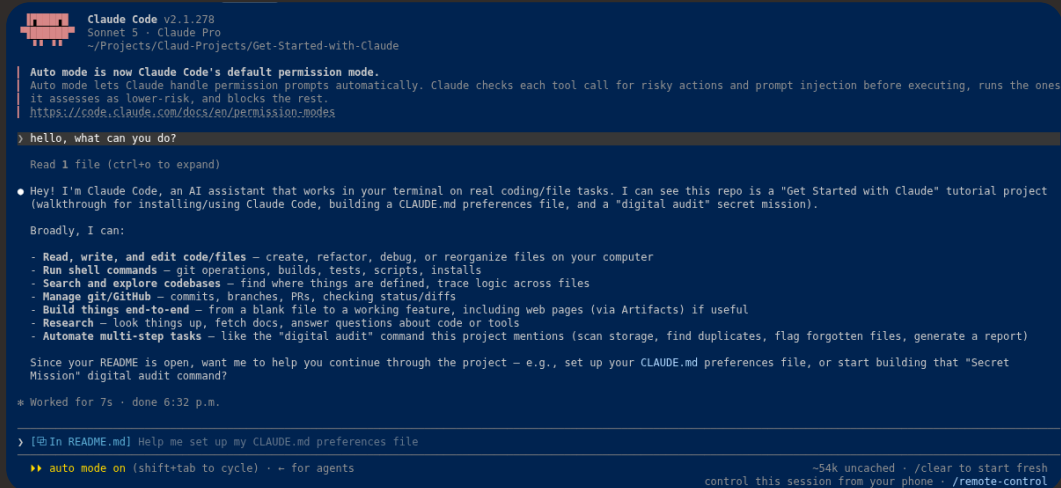

Goals and learning objectives

In this project, we're learning about Claude Code, how to install it, learn its safety modes and prompting patterns and use it to organize files on my computer. By the end, we'll have a working setup of Claude Code as our personal AI assistant for file management, organization and automation.

Getting Started with Claude Code

Setting up the environment

In this step, I'm setting up my subscription in Claude Code so that I can install and launch Claude Code and authenticate and start with our project.

```
Claude Code v2.1.278
Sonnet 5 - Claude Pro
~/Projects/Claude-Projects/Get-Started-with-Claude

Auto mode is now Claude Code's default permission mode.
Auto mode lets Claude handle permission prompts automatically. Claude checks each tool call for risky actions and prompt injection before executing, runs the ones
it assesses as lower-risk, and blocks the rest.
https://code.claude.com/docs/en/permissions-modes

> hello, what can you do?

Read 1 file (ctrl+o to expand)

• Hey! I'm Claude Code, an AI assistant that works in your terminal on real coding/file tasks. I can see this repo is a "Get Started with Claude" tutorial project
(walkthrough for installing/using Claude Code, building a CLAUDE.md preferences file, and a "digital audit" secret mission).

Broadly, I can:

- Read, write, and edit code/files - create, refactor, debug, or reorganize files on your computer
- Run shell commands - git operations, builds, tests, scripts, installs
- Search and explore codebases - find where things are defined, trace logic across files
- Manage git/GitHub - commits, branches, PRs, checking status/diffs
- Build things end-to-end - from a blank file to a working feature, including web pages (via Artifacts) if useful
- Research - look things up, fetch docs, answer questions about code or tools
- Automate multi-step tasks - like the "digital audit" command this project mentions (scan storage, find duplicates, flag forgotten files, generate a report)

Since your README is open, want me to help you continue through the project - e.g., set up your CLAUDE.md preferences file, or start building that "Secret
Mission" digital audit command?

* Worked for 7s · done 6:32 p.m.

> [📖 In README.md] Help me set up my CLAUDE.md preferences file

➡ auto mode on (shift+tab to cycle) · - for agents

-54k uncached · /clear to start fresh
control this session from your phone · /remote-control
```

Exploring Claude's capabilities

When I asked Claude what it can do, it told me that it can:

- Read, write, and edit code/files. - create, refactor, debug, or recognize files on my computer.
- Run shell commands - git operations, builds, tests, scripts, installs.
- Search and explore codebases - find where things are defined, trace logic across files
- Manage git/GitHub - commits, branches, PRs, checking status/diffs
- Build things end-to-end - from a blank file to a working feature, including web pages (via Artifacts) if useful
- Automate multi-step tasks - like the `digital audit` command this project mentions (scan storage, find duplicates, flag forgotten files, generate a report)

Working Safely with AI File Management

Understanding permission-based actions

In this step, I'm asking Claude to analyze my Downloads folder, so that I can organize the files and sort everything to subfolders. And along the way we'll learn how Claude asks for permission before doing anything.

How Claude requests permission before acting

I noticed that Claude always output its plan so that I can review/check/validate the work I asked Claude to do and it ask for permission first before it executes its suggested plan.

Configuring Claude with a Persistent Memory File

Creating a CLAUDE.md preferences file

In this step, I'm creating a Claude.md preferences file using the `/init` command so that Claude can remember our preferences automatically and use them in future sessions.

```
> I want to reorganize my Projects/. What's your plan?

Searched for 1 pattern, listed 1 directory, ran 1 shell command

• Here's what's actually in ~/Projects/:

Projects/
├── Automation/GitHub-Actions-Basic-CI-CD-Pipeline/ (git: GitHub-Actions-Basic-CI-CD-Pipeline)
├── AWS/aws-eks/ (git: AWS-EKS-Deployment)
├── Claude-Projects/Get-Started-with-Claude/ (git: none, this repo)
├── k8s-projects/ (git: Build-your-local-Kubernetes-cluster)
│   ├── build-k8s/
│   ├── helm-tutorial/helloworld/
│   ├── k8s-Helm/ (git: k8s-Helm) – has ecomdb, ecomweb, ecomwebapp, .tgz chart packages
│   ├── ecommerce-app/ (no .git) – has ecomdb, ecomwebapp, k8s-ecommerce-challenge
│   └── old-learning-app-ecommerce/ (git: kubernetes-resume-challenge) – has .bak files, backup yaml

Three things worth flagging before I propose a layout:

1. Security issue: k8s-projects/ecommerce-app/Dockerhub PAT: is a plain file (not a folder – the colon is literally in the filename) sitting loose in the project tree. I didn't open it, but the name strongly suggests it holds a Docker Hub access token. It's not tracked by any git repo, but it shouldn't be sitting there as a bare file either way.
2. Overlap: ecommerce-app, k8s-Helm, old-learning-app-ecommerce, and helm-tutorial all seem to be different iterations of the same e-commerce/Helm learning exercise (repeated ecomdb/ecomwebapp folders). I don't want to guess which are live vs. superseded.
3. Typo: Claud-Projects is presumably meant to be Claude-Projects.

Before I move anything, I'd like your call on the two things that actually matter:

- [x] Secret file [x] Duplicate projects ✓ Submit -x

| The 'Dockerhub PAT:' file likely contains a Docker Hub access token sitting as a bare file. What should I do with it?
> 1. Delete it (Recommended)
   Remove the file entirely. If the token in it is real, you should also rotate it on Docker Hub.
2. Just rename/flag it
   Leave the content as-is but rename so it's not left mid-project (e.g. move to a .secrets/ file you .gitignore).
3. Leave it, I'll handle it
   Don't touch it – I'll deal with the token myself outside this reorg.
4. Type something.
5. Chat about this

Enter to select · Tab/Arrow keys to navigate · Esc to cancel
```

Personalizing Claude's behavior

I included rules like:

- Always show the full plan (which files go where, including any duplicates found) before moving anything.
- Wait for explicit approval before executing any moves. Do not batch-execute without confirmation, even within a single session.

I included this because I want Claude to always have a confirmation with me first before executing anything. In that way I can see what changes are to be made by Claude and if need be, I can address changes that are not align with my preferences.

Running a Full Storage Audit

Findings and reusable workflow

In this project extension, I found 6MB of duplicates from the Downloads/ and was moved to a folder named Duplicates/ for review. This is how I adjusted my workflow custom command as I do not want to delete duplicate files outright. I got 3.4GB of reclaimable space, all in all then saved the workflow as a custom command named `audit.md` that I can run monthly.

Reflections and Key Takeaways

Tools and concepts learned

The key tools I used include Code Claude and some Linux navigation in the terminal. Key concepts I learnt includes best practices when prompting;

- Be specific of what you need.
- Always ask Claude Code to show its plan first
- Build on results.

If you are unsure of what needs to be done (eg: build a resume), let Claude interview you to get its inputs. Let Claude do the work for you instead of you wasting time thinking of what you want Claude to do.

You can also ask Claude to be your personal AI assistant to organize large/duplicate files and make a report and once reviewed, you can then instruct Claude to organize it for you.

In relation to the above, Claude forgets everything we about what I did and so I created CLAUDE.md file for our preferences once so that Claude remembers them automatically in every future sessions.

You can also ask Claude to scan multiple folders, create a markdown report, turn into a workflow and create a custom command that you can run monthly.

Time and challenges

This project took me approximately a day since I'm a working professional and reviewing for my CKA recertification. The most challenging part was just to manage time honestly because I have to work on other stuffs too.

Looking ahead

I did this project today to learn how to get started with Claude Code. I want to finish this Claude Code Roadmad. Another skill I want to invest in are other AI projects.
